Patient Position: Position so IOML is perpendicular to the table and head is in a symmetrical position (no rotation or tilt).
Patient Instructions: Instruct patient to keep eyelids gently closed.
Scan Range: Scan above orbital roof through orbital floor.

Recons and Reformations: Coronal and sagittal MPRs made in examination card using raw data in bone and soft tissue kernels. If unable to place patient in ideal position, make axial MPRs parallel to optic nerve in bone and soft tissue kernels. If performed with and without IV contrast, create ALL reformats on both data sets-unenhanced and enhanced series.
