

## Total Shoulder Arthroplasty - Dr. Lehman, MD

This protocol is based The American Society of Shoulder and Elbow Therapists' consensus statement on rehabilitation for anatomy total shoulder arthroplasty (1). This program is an evidence-based and soft tissue healing dependent program allowing patients to progress to vocational and sports-related activities as quickly and safely as possible. Individual variations will occur depending on surgical technique and the patient's response to treatment. **See surgeon's operative note for specific range of motion restrictions especially EXTERNAL ROTATION.** Please contact us at 1-800-362-9567 ext. 58600 if you have questions or concerns.

Phase I: 0-6 weeks	Immediate Post Operative Maximum Protection Phase
<b>Goals</b>	<ul style="list-style-type: none"> <li>• Protect the subscapularis tendon repair</li> <li>• Decrease joint effusion and soft tissue edema</li> <li>• Decrease pain</li> </ul>
<b>Restrictions</b>	<ul style="list-style-type: none"> <li>• No lifting, pushing, and pulling</li> </ul>
<b>Sling</b>	<ul style="list-style-type: none"> <li>• Continue with wearing Sling Shot brace until directed otherwise by surgeon.</li> </ul>
<b>PROM/ AAROM/AROM</b>	<ul style="list-style-type: none"> <li>• Review operative note for "safe zone" of external rotation</li> <li>• No active range of motion</li> <li>• AAROM/PROM flexion and abduction to tolerance</li> </ul>
<b>Strengthening</b>	<ul style="list-style-type: none"> <li>• Rehabilitation specialists should select exercises that demonstrate less than 15% maximum voluntary isometric contraction (MVIC) on electromyography for the subscapularis as these guidelines have been proposed as a safe level of activation following rotator cuff repair</li> <li>• See "Treatment Interventions" section below for exercises that fall below 15%.</li> </ul> <p><b>Considerations:</b> Per the consensus statement supine exercises soon after the anatomic total shoulder arthroplasty are challenging due to:</p> <ul style="list-style-type: none"> <li>• If the arm is not well supported in the plane of the scapulae, there may be painful strain across the healing incision, anterior joint capsule, and subscapularis tendon</li> <li>• Many patients are challenged with getting in and out of supine position without weightbearing on the surgical arm</li> <li>• Finding a place to sit to do range of motion is likely more convenient than lying, which may assist with home exercises compliance</li> </ul>
<b>Treatment Interventions</b>	<p><b>The exercises listed below are &lt;15% MVIC for subscapularis (2):</b></p> <ul style="list-style-type: none"> <li>• Pulley-assisted elevation: 8%</li> <li>• Table Slide: 10%</li> <li>• Prone Shoulder Flexion: 12%</li> <li>• Seated Row: 14%</li> <li>• Wall-Assisted External Rotation: 15%</li> <li>• <b>Supine-assisted elevated was found to be higher than the recommended level: 24%</b></li> </ul> <p><b>See Table 1 listed below for % MVIC ranking of each exercise for the subscapularis</b></p>
<b>Modalities</b>	<ul style="list-style-type: none"> <li>• As needed for pain control</li> </ul>

<b>Phase II: 6-12 weeks</b>	<b>Range of Motion Phase</b>
<b>Goals</b>	<ul style="list-style-type: none"> <li>• Gradually restore range of motion</li> <li>• Expected range of motion varies based on preoperative diagnosis of Anatomy Total Shoulder Arthroplasty</li> <li>• Anatomy Total Shoulder Arthroplasty have been shown to achieve 140-150 degrees of scapular elevation, 50-60 degrees of external rotation at the side, and internal rotation to the upper lumbar spine (3)</li> </ul>
<b>Restrictions</b>	<ul style="list-style-type: none"> <li>• See Operative Note for specific external rotation range of motion limits</li> <li>• No lifting greater than 1 lb (“a cup of coffee”)</li> <li>• Avoid excess overpressure to protect healing joint</li> <li>• Closed kinetic chain in both weight-bearing and non-weightbearing positions are not indicated</li> </ul>
<b>Range of Motion</b>	<ul style="list-style-type: none"> <li>• AROM/AAROM/PROM: no restrictions except ER based on operative note</li> </ul>
<b>Strengthening</b>	<ul style="list-style-type: none"> <li>• <b>Active range of motion exercises with no lifting &gt;1 lb</b></li> </ul>
<b>Treatment Interventions</b>	<p><b>Active Assisted Range of Motion</b></p> <ul style="list-style-type: none"> <li>• Wall walks</li> <li>• Pulleys: elevation/flexion</li> <li>• Seated AAROM with dowel</li> </ul> <p><b>Active Range of Motion</b></p> <ul style="list-style-type: none"> <li>• Sidelying external rotation</li> <li>• Supine shoulder flexion</li> <li>• Sidelying shoulder abduction</li> <li>• Prone I, Prone Y, and Prone T</li> <li>• Prone horizontal abduction with external rotation</li> <li>• Scapular retraction</li> <li>• Supine serratus punch</li> </ul>

Phase III: 12+ Weeks	Strength Phase
<b>Goals</b>	<ul style="list-style-type: none"> <li>• Restore end range mobility of the shoulder in all planes</li> <li>• Increase rotator cuff strength to 5/5</li> <li>• A gradual return to prior level such as golf, tennis, and swimming is allowed, with full return to play restricted until post operative month 6 to allow for subscapular tendon healing</li> </ul>
<b>Restrictions</b>	<ul style="list-style-type: none"> <li>• No weight restrictions</li> <li>• Heavy impact loading such as bench press, wood chopping, and use of a sledgehammer is not advised (1)</li> </ul>
<b>Range of Motion</b>	<ul style="list-style-type: none"> <li>• As tolerated</li> </ul>
<b>Strengthening</b>	<ul style="list-style-type: none"> <li>• Strengthening exercises may progress gradually using light hand weight or elastic band resistance</li> <li>• Closed kinetic chain exercises are now permitted including planks, yoga poses, and quadruped exercises</li> </ul>
<b>Treatment Interventions</b>	<ul style="list-style-type: none"> <li>• Closed kinetic chain exercises including planks, quadruped shoulder stabilization exercises, ball on wall, lateral reaches on wall, etc.</li> <li>• Continue with phase 2 exercises as needed</li> <li>• Scaption</li> <li>• Overhead press</li> <li>• PNF D1/D2 stabilization</li> <li>• Bicep strengthening</li> <li>• 90/90 external rotation strengthening</li> <li>• Body blade exercises</li> </ul>

Table 1. Subscapularis pooled means (range) of percent MVIC ranking of exercise. Copied from Reference (2)

<b>Exercise</b>	<b>% Maximum Voluntary Isometric Contraction</b>
<b>Pulley Assisted Elevation</b>	8%
<b>Table Slide</b>	10%
<b>Prone Shoulder Flexion</b>	12%
<b>Seated Row</b>	14%
<b>Wall-Assisted External Rotation</b>	15%
<b>Upright Bar-Assisted Elevation</b>	24%
<b>Upright Bar-Assisted External Rotation</b>	27%
<b>Forward Punch</b>	35%
<b>Internal Rotation: 0° of Abduction</b>	40%
<b>Internal Rotation: 45° of Abduction</b>	53%
<b>External Rotation: 0° of Abduction</b>	57%
<b>External Rotation: 90° of Abduction</b>	57%
<b>Dynamic Hug</b>	58%
<b>Diagonal</b>	60%
<b>Internal Rotation: 90° of Abduction</b>	65%
<b>Low Row</b>	69%
<b>High Row</b>	74%
<b>Standing Row</b>	81%
<b>Resisted Shoulder Extension</b>	97%
<b>Resisted Active Elevation/Flexion</b>	99%

\*\*\*If you have any questions regarding how to perform the exercise see Reference 2.
